ABSTRACT OF THE DISCLOSURE

A system and a method that use reference codes to establish properties of program modules. It includes a storage medium for storing a table with function descriptions and the corresponding reference codes, describing the function properties of each program module. Each of the program modules has a program pointer with a specific reference code. When writing a program, one follows the function description and reference code table to insert the reference codes into the source codes of different program properties. They are then used as the reference for programming, linking and debugging.
